- Forging a Signature
- Remarks

- Digital Signature Standard (DSS)

- Remarks

# How does it work?

Assume you were going to send the draft of a contract to your lawyer in another town. You want to give your lawyer the assurance that it was unchanged from what you sent and that it is really from you.

- You copy-and-paste the contract into an e-mail note.
- Using special software, you obtain a message hash (mathematical summary) of the contract.
- You then use a private key that you have previously obtained from a public-private key authority to encrypt the hash. The encrypted hash becomes your digital signature of the message.

At the other end, your lawyer receives the message. To make sure it's intact and from you, your lawyer makes a hash of the received message. Your lawyer then uses your public key to decrypt the message hash or summary. If the hashes match, the received message is valid.

# RSA Signature Scheme

Let  $n = pq$ , where  $p$  and  $q$  are primes. Let  $\mathcal{M} = \mathcal{S} = \mathbb{Z}_n$ , and define

$\mathcal{K} = \{ (n, p, q, e, d) : n = pq, p, q \text{ prime}, ed \equiv 1 \pmod{\phi(n)} \}$ .

The value  $(e, n)$  is the public key, and  $(d, n)$  is the private key.

For  $\mathcal{K} = \{(n, p, q, e, d)\}$ , define

$$y = \text{sig}_k(x) = x^d \pmod{n}$$

and

$$\text{ver}_k^-(x, y) = \text{true} \Leftrightarrow x \equiv y^e \pmod{n}$$

$(x, y \in \mathbb{Z}_n)$ .

Clearly, the security level of the RSA signature scheme is exactly the same as for the RSA cryptosystem.

# In Practice

## (a) Setup:

- 1) Generate two large random primes  $p$  and  $q$  ( $p \neq q$  and  $|p| \approx |q|$ )
- 2) Compute  $n = pq$  and  $\phi = (p - 1)(q - 1)$
- 3) Select a random integer  $e$ ,  $1 < e < \phi$  such that  $\text{GCD}(e, \phi) = 1$
- 4) Use EEA( $\phi, e$ ) algorithm to find  $d$  such that  $ed \equiv 1 \pmod{\phi}$
- 5) Publish  $(e, n)$  as verification (public) key
- 6) Keep  $(d, n)$  as signing (secret) key

## (b) Signature Generation:

- 1)  $y = \text{sig}_{(d,n)}(x) = \text{PowerMod}(x, d, n)$  where  $x$  is some message

## (c) Signature Verification:

- 1) Compute  $\text{ver}_{(e,n)}(x, y) = 1$  (true) if  $\text{PowerMod}(y, e, n) = x$ , otherwise  $\text{ver}_{(e,n)}(x, y) = 0$  (false)

# Example

(a) Setup:

- 1) Let  $p=47, q=71$
- 2) Let  $n = pq = 3337, \phi = 46 \times 70 = 3220$
- 3) Choose  $e$  (at random) to be 79
- 4) Compute EEA(3220, 79) to find  $d$

| $\phi$ | $e$ | $q$ | $\gcd(\phi, e)$ | $x$ | $y$  |             |
|--------|-----|-----|-----------------|-----|------|-------------|
| 3220   | 79  | 40  | 1               | -25 | 1019 | -> $d=1019$ |
| 79     | 60  | 1   | 1               | 19  | -25  |             |
| 60     | 19  | 3   | 1               | -6  | 19   |             |
| 19     | 3   | 6   | 1               | 1   | -6   |             |
| 3      | 1   | 3   | 1               | 0   | 1    |             |
| 1      | 0   | -   | 1               | 1   | 0    |             |

- 5) Verification key = (79, 3337)
- 6) Signing key = (1019, 3337)

Message  $x = 999$

(b) Signature Generation:

1)  $y = sig_{(1019,3337)}(999) = \text{PowerMod}(999, 1019, 3337)$

| $i$   | 9   | 8   | 7    | 6    | 5   | 4  | 3    | 2   | 1   | 0       |
|-------|-----|-----|------|------|-----|----|------|-----|-----|---------|
| $b_i$ | 1   | 1   | 1    | 1    | 1   | 1  | 1    | 0   | 1   | 1       |
| $x$   | 999 | 835 | 2439 | 2415 | 786 | 54 | 3220 | 341 | 412 | 1264 =y |

(c) Signature Verification:

1) Compute  $\text{PowerMod}(1264, 79, 3337)$

| $i$   | 6    | 5    | 4    | 3   | 2    | 1    | 0   |
|-------|------|------|------|-----|------|------|-----|
| $b_i$ | 1    | 0    | 0    | 1   | 1    | 1    | 1   |
| $y$   | 1264 | 2610 | 1283 | 289 | 1212 | 1709 | 999 |

$$\text{PowerMod}(1264, 79, 3337) = 999 = x \Rightarrow ver_{(79,3337)}(1264,999) = 1(true)$$

# ElGamal Signature Scheme

## 1985

Let  $p$  be a prime such that the discrete logarithm problem in  $\mathbb{Z}_p$  is intractable and let  $\alpha \in \mathbb{Z}_p^*$  be a primitive element. Let  $\mathcal{M} = \mathbb{Z}_p^*$ ,  $\mathcal{S} = \mathbb{Z}_p^* \times \mathbb{Z}_{p-1}$ , and define

$$\mathcal{K} = \{(p, \alpha, a, \beta) : \beta \equiv \alpha^a \pmod{p}\}.$$

The values of  $p$ ,  $\alpha$  and  $\beta$  are public and  $a$  is secret. For  $K = (p, \alpha, a, \beta) \in \mathcal{K}$  and for a secret random number  $k \in \mathbb{Z}_{p-1}^*$  define

$$\text{sig}_K(x, k) = (\gamma, \delta)$$

where  $\gamma = \alpha^k \pmod{p}$  and  $\delta = (x - a\gamma)k^{-1} \pmod{p-1}$ .

For  $x, \gamma \in \mathbb{Z}_p^*$  and  $\delta \in \mathbb{Z}_{p-1}$ , define

$$\text{ver}_K^-(x, \gamma, \delta) = \text{true} \Leftrightarrow \beta^\gamma \gamma^\delta \equiv \alpha^x \pmod{p}$$

# In Practice

## (a) Setup:

- 1) Generate a large random prime  $p$  and a generator  $\alpha$  of  $\mathbb{Z}_p^*$
- 2) Select a random integer  $a$ ,  $1 \leq a \leq p - 2$
- 3) Compute  $\beta = \text{PowerMod}(\alpha, a, p)$
- 4) Publish  $(p, \alpha, \beta)$  as signing (public) key
- 5) Keep  $a$  as verification (secret) key

## (b) Signature Generation:

- 1) Select a random integer  $k$ ,  $1 \leq k \leq p - 2$
- 2) Compute  $\gamma = \text{PowerMod}(\alpha, k, p)$
- 3) Use EEA( $k, p - 1$ ) algorithm to find  $k^{-1}$
- 4) Compute  $\delta = (x - a\gamma) k^{-1} \bmod (p - 1)$ , where  $x$  is the message
- 5)  $y = (\gamma, \delta)$

## In Practice (cont.)

### (c) Signature Verification:

- 1) Verify that  $1 \leq \gamma \leq p - 1$ ; if not, then reject the signature
- 2) Compute  $v_1' = \text{PowerMod}(\beta, \gamma, p)$
- 3) Compute  $v_1'' = \text{PowerMod}(\gamma, \delta, p)$
- 4) Compute  $v_1 = v_1' v_1'' \bmod p$
- 5) Compute  $v_2 = \text{PowerMod}(\alpha, x, p)$
- 6) Accept the signature iff  $v_1 = v_2$

# Example

(a) Setup:

1) Let  $p = 2579$ ,  $\alpha = 2$

2) Let  $a = 765$

3)  $\beta = \text{PowerMod}(2, 765, 2579)$   $b = 765_{10} = \langle 1011111101 \rangle_2$

| $i$      | 9 | 8 | 7  | 6    | 5    | 4   | 3    | 2    | 1    | 0   |          |
|----------|---|---|----|------|------|-----|------|------|------|-----|----------|
| $b_i$    | 1 | 0 | 1  | 1    | 1    | 1   | 1    | 1    | 0    | 1   |          |
| $\alpha$ | 2 | 4 | 32 | 2048 | 1700 | 461 | 2086 | 1246 | 2537 | 949 | $=\beta$ |

4) Public (2579, 2, 949) as signing (public) key

5) Keep 765 as verification (secret) key

(b) Signature Generation:

1)  $k=853$

2)  $\gamma = \text{PowerMod}(2, 853, 2579)$

$$b = 853_{10} = \langle 1101010101 \rangle_2$$

| $i$      | 9 | 8 | 7  | 6   | 5   | 4    | 3    | 2    | 1    | 0   |           |
|----------|---|---|----|-----|-----|------|------|------|------|-----|-----------|
| $b_i$    | 1 | 1 | 0  | 1   | 0   | 1    | 0    | 1    | 0    | 1   |           |
| $\alpha$ | 2 | 8 | 64 | 455 | 705 | 1135 | 1304 | 1710 | 2093 | 435 | $=\gamma$ |

3) Compute EEA(2578, 853) to find  $k^{-1}$

| $p-1$ | $k$ | $q$ | $\gcd(p-1, k)$ | $x$  | $y$  |           |
|-------|-----|-----|----------------|------|------|-----------|
| 2578  | 853 | 3   | 1              | -404 | 1221 | $=k^{-1}$ |
| 853   | 19  | 44  | 1              | 9    | -404 |           |
| 19    | 17  | 1   | 1              | -8   | 9    |           |
| 17    | 2   | 8   | 1              | 1    | -8   |           |
| 2     | 1   | 2   | 1              | 0    | 1    |           |
| 1     | 0   | -   | 1              | 1    | 0    |           |

4)  $x=999, \delta=(999-765 \times 435) \times 1221 \bmod 2578 = 690$

5)  $y = (435, 690)$

(c) Signature Verification:

1)  $1 \leq 435 \leq 2578$

2)  $v'_1 = \text{PowerMod}(949, 435, 2579)$   $b = 435_{10} = \langle 110110011 \rangle_2$

| $i$     | 9   | 8  | 7    | 6    | 5    | 4   | 3    | 2    | 1    | 0       |
|---------|-----|----|------|------|------|-----|------|------|------|---------|
| $b_i$   | 1   | 1  | 0    | 1    | 1    | 0   | 0    | 1    | 1    |         |
| $\beta$ | 949 | 65 | 1646 | 1676 | 1928 | 845 | 2221 | 1996 | 1710 | $=v'_1$ |

3) Compute  $v''_1 = \text{PowerMod}(435, 690, 2579)$

$b = 690_{10} = \langle 1010110010 \rangle_2$

| $i$      | 9   | 8   | 7   | 6    | 5    | 4    | 3    | 2    | 1    | 0             |
|----------|-----|-----|-----|------|------|------|------|------|------|---------------|
| $b_i$    | 1   | 0   | 1   | 0    | 1    | 1    | 0    | 0    | 1    | 0             |
| $\gamma$ | 435 | 958 | 719 | 1161 | 2248 | 1694 | 1788 | 1563 | 1670 | 1001 $=v''_1$ |

4) Compute  $v_1 = 1710 \times 1001 \bmod 2579 = 1833$

5) Compute  $v_2 = \text{PowerMod}(2, 999, 2579)$

$b = 999_{10} = \langle 1111100111 \rangle_2$

| $i$      | 9 | 8 | 7   | 6    | 5    | 4   | 3    | 2    | 1    | 0           |
|----------|---|---|-----|------|------|-----|------|------|------|-------------|
| $b_i$    | 1 | 1 | 1   | 1    | 1    | 0   | 0    | 1    | 1    | 1           |
| $\alpha$ | 2 | 8 | 128 | 1820 | 1928 | 845 | 2221 | 1007 | 1004 | 1833 $=v_2$ |

6) We Accept the signature since  $v_1 = v_2$

# Forging a Signature

Let  $i, j \in \mathbb{Z}$ ,  $0 \leq i, j \leq p - 2$  and  $\gcd(j, p - 1) = 1$

Can Eve sign a random message  $x = -\gamma i j^{-1} \bmod (p - 1)$  by choosing  $\gamma = \alpha^i \beta^j \bmod p$  and  $\delta = -\gamma j^{-1} \bmod (p - 1)$ ?

where  $j^{-1}$  is computed modulo  $(p - 1)$ .

➤ Try answering this question by using  $p=467$ ,  $\alpha=2$ ,  $\beta=132$ ,  $i=99$ ,  $j=179$ .

# Remarks

- As for the ElGamal cryptosystem, the security of the ElGamal signature scheme is based on the discrete logarithm problem modulo  $p$
- One feature that is different from RSA signature scheme is that, with the ElGamal method, there are many different signatures that are valid for a given message
- The ElGamal signature scheme is an example of **signatures with appendix**. The message is not easily recovered from the signature  $(\gamma, \delta)$ . The message  $x$  must be included in the verification process. This is in contrast with the RSA signature scheme, which is a **message recovery scheme**. In this case, the message is readily obtained from the signature  $y$ . Therefore, only  $y$  needs to be sent since anyone can deduce  $x$  as  $y^e \pmod{n}$

# Digital Signature Standard (DSS)

## 1993 by National Institute of Standards and Technology (NIST)

Let  $p$  be a 1024bit prime and let  $q$  be a 160bit prime that divides  $p - 1$ .

Let  $\alpha \in \mathbb{Z}_p^*$  be an element of order  $q$ . Let  $\mathcal{M} = \{0,1\}^*$ ,  $S = \mathbb{Z}_q \times \mathbb{Z}_q$ , and define

$$\mathcal{K} = \{(p, q, \alpha, a, \beta) : \beta \equiv \alpha^a \pmod{p}\},$$

where  $0 \leq a \leq q - 1$ . The values  $p, q, \alpha$  and  $\beta$  are the public key, and  $a$  is the private key.

For  $K = (p, q, \alpha, a, \beta)$ , and for a (secret) random number  $k$ ,  $1 \leq k \leq q - 1$ , define

$$\text{sig}_K(x, k) = (\gamma, \delta),$$

Where

$$\begin{aligned} \gamma &= (\alpha^k \bmod p) \bmod q \text{ and} \\ \delta &= (\text{SHA-1}(x) + a\gamma)k^{-1} \bmod q. \end{aligned}$$

The DSS is a variant of ElGamal Signature Scheme

# Digital Signature Standard (cont.)

For  $x \in 0,1^*$  and  $\gamma, \delta \in \mathbb{Z}_p^*$ , verification is done by performing the following computations:

$$\begin{aligned}e_1 &= \text{SHA-1}(x)\delta^{-1} \bmod q \\e_2 &= \gamma\delta^{-1} \bmod q\end{aligned}$$

$$\text{ver}_K^-(x, (\gamma, \delta)) = \text{true} \Leftrightarrow (\alpha^{e_1}\beta^{e_2} \bmod p) \bmod q = \gamma.$$

# Remarks

- Digital Signature Standard (DSS) is the digital signature algorithm (DSA) developed by the U.S. National Security Agency (NSA) to generate a digital signature for the authentication of electronic documents
- ElGamal scheme is a pair  $(\gamma, \delta)$ , where  $\gamma$  and  $\delta$  are integers modulo  $p$  and  $p - 1$ , respectively. In 1994 it was already necessary to choose  $p$  as a 512-bit prime in order to make the ElGamal scheme secure. Thus, an ElGamal signature can be expected to have 1024 bits. This is too long for typical applications such as smart cards. Nowadays it would be preferable to choose a 1024-bit prime  $p$ , leading to 2048-bit ElGamal signatures.
- DSS signs 160-bit messages with a 320-bit signature, but the computations are done using a prime modulus  $p$  that has between 512 and 1024 bits.
